Space is limited

How the best perform

We will discuss the diagnosis, construction/ restoration and maintenance of an implant based on a real live case. This case is one that might show up in any GP practice and be misdiagnosed.

Dan will review the actual diagnosis of this case using cone beam images. How the variable field of view was used, software functionality and equipment design for optimum image quality. He will also cover the use of software in placing the implant.

Jennifer will discuss the implant placement and restoration. She will cover the latest technologies as well as the use of digital technology for best results.

Ronda will then explore the newest technology in maintenance of the implant, Air Flow and Guided Biofilm Therapy, to keep it healthy and have the best long term result for the patient.
